#### About Philippe J.S. De Brouwer

Dr. Philippe De Brouwer studied theoretical physics and later acquired a second Master –Business Engineer– while working full time. Finishing this Master he solved the "fallacy of large numbers puzzle" that was formulated by P.A. Samuelson 38 years earlier. In this Ph.D. he successfully challenged the assumptions of the Noble price winning "Mean Variance Theory" of H. Markovitz that dominated our thinking about suitability of investments for more than 60 years.

In the start of his career he moved from insurance to banking focusing and from IT to asset management. For Fortis (BNP) he helped the young investment management company grow, stood at the cradle of one of the first capital guaranteed funds and got promoted to director in 2000. In 2002 he moved to KBC where he merged 4 companies and became CEO of the merged entity in 2005. Under his direction the company climbed from number 11 to number 5 on the market. In the aftermath of the crisis he helped creating a new investment management company for KBC in Ireland that soon accommodated the management of ca. 1000 investment funds and had about 24 Bln Euro under management. In 2012 he widened his scope to financial risk management and specializing in statistics, analytics, data and numerical methods. In 2015 Philippe was head of Analytics Development for the Royal Bank of Scotland Group and is now director at HSBC and oversees the Independent Model Review Centre of Excellence.

Philippe also found a passion in coaching on team leadership and teamwork as well as teaching (mainly for Vlerick Business School and the University of Warsaw).

# Who are you

## Question

Who are you? What do you expect from this program? What do you want from this program? What should we focus on?

# **Practical Information**

#### **Questions?**

### Availability of Slides and other materials

Course materials:

- 1. url: http://www.de-brouwer.com
- 2. select "For Students" and then choose your university
- 3. locate your program
- 4. locate the relevant course and download your materials
- 5. materials availabe on the usual platform

# Materials from "the Big R-Book":

- 1. videos and code: http://www.de-brouwer.com/publications/
   r-book/index.html
- 2. code and slides: http://www.de-brouwer.com/publications/ r-book/18901229-for-teachers.html

# The Program Quantitative Methods

# 3.1 Objectives

**Objectives of the program** 

know	the basics of statistics and data manipulation
know	at least one analytical tool (R)
understand	the importance of data in decision making
understand	uses and limits of various methods
apply	understand limits of models
appiy	dideistand influs of models
apply	make informed decisions
apply	write a technical paper
apply	write a presentation and present it

# 3.2 The content of the program

## The content of the program

- 1. (optional) Getting started with R and its use
- 2. SQL Databases and importing data in R
- 3. Data wrangling (preparing data to build a model)
- 4. Building powerful models (linear regressions, generalised linear regression, non-linear regression, decision tree, random forest, SVN, neural network, etc.) and model validation
- 5. (optional) Introduction to companies and financial markets
- 6. Automating presentations, documents, etc.
- 7. (optional) Big Data
- 8. (optional) Code performance (speeding up R)

## The Big R-Book

From data science to learning machines and big data
See: http://www.de-brouwer.com/publications/r-book/
Slides will be made available
De Brouwer (2020)

## Grading of the course

- 20% presence and collaboration in classroom (including in-class assignments)
- 70% selected assignment (details see Chapter *Assigments*, page 11)

# 3.3 Assignments

Assignment

Definition 1 the assignement		
Students are expected to gather data, analyse it and report the results in		
1. a paper (between 5 and 50 pages)		
2. a presentation (life in the classroom)		
the last session in a presentation.		

During the last lesson each project can be presented in a "10 minutes elevator pitch" + 10 minutes questions

## The Grading of the assignement

*The assignment is 70% of the total grade. It splits as follows.* 

- 40% for the idea, logic, coherence, and conclusions
- 30% for the written materials (paper and/or slides)
- 30% for the presentation itself (quality of slides if used + oratorical qualities)

The assignments are individual works (but collaboration is allowed).

### Ideas for the content of the Assignment

- 1. start from the template that will be provided
- 2. solve a problem by using data and rely on one or more of the methods studied (eg. regression, MCDA), etc.
- 3. use one of the ideas on the following slides.

## 3.3.1 Bring your own data

#### Assignment

#### Question

Consider your company or business, identify a problem worth solving, get the data and present a solution.

Maybe you have a project that you are already working on for another reason?

# 3.3.2 Crimes in the USA

Assignment

Crime Data

#### Question

Based on the data-set UScrime (in the package MASS), what would you recommend to reduce crime? Write also about the limitations of your findings.

Challenge: find your own data, better data that is richer and more up-to-date.

# 3.3.3 Market data

#### Assignment

Market Data

### Question

Find data relating to shares or indices on financial markets, calculate Value at Risk and Expected Shortfall.

Variant: try to predict market movement.

# 3.3.4 What influences the GDP-growth?

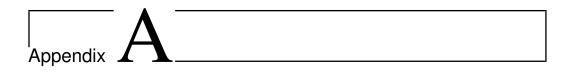

### Assignment

## Question

Find out what governments should focus on in order to improve the GDP per capita, using public data.

Suggestions:

- 1. use https://data.oecd.org to download data,
- 2. think of a simple method to make it work (correlate the result to the chosen indicators N-years in the past (better still, use averages, etc.)

# Levels of Measurement

#### Levels of Measurement

Introduction

It is customary to refer to the theory of scales as having been developed by Stevens (1946). In that paper he argues that all measurement is done by assuming a certain scale type. He distinguished four different types of scale: nominal, ordinal, interval, and ratio scales.

# A.1 Nominal Scale

#### Nominal Scale

The simplest form of classification: labels that do not assume an order. Examples: asset classes, first names, countries, days of the month. It is not possible to use statistics such as average or median. We can measure which label occurs the most (modus of mode).

Scale Type	Nominal
Characterization	labels (e.g. asset classes)
Permissible Statistics	mode, chi-square
Permissible Scale Transformation	equality
Structure	unordered set

Table A.1: Characterization of the Nominal Scale of Measurement.

Note that it is possible to use numbers as labels, but that this is very misleading. When using an nominal scale, none of the traditional metrics (such as averages) can be used.

# A.2 Ordinal Scale

#### **Ordinal Scale**

This scale type assumes a certain order. An example is a set of labels such as very safe, moderate, risky, very risky. Bond rating such as AAA, BB+, etc. also are ordinal scales: they indicate a certain order, but there is no way to determine if the distance between, say, AAA and AA- is similar to the distance between BBB and BB-. It may make sense to talk about a median, but it does not make any sense to calculate an average (as is sometimes done in the industry and even in regulations)

Scale Type	Ordinal Scale
Characterization	ranked labels (e.g. ratings for bonds
	from rating agencies)
Permissible Statistics	median, percentile
Permissible Scale Transforma-	order
tion	
Structure	(strictly) ordered set

#### Table A.2: Characterization of the Ordinal Scale of Measurement.

Ordinal labels can be replaced by others if the strict order is conserved (by a strict increasing or decreasing function). For example AAA, AA-, and BBB+ can be replaced by 1, 2 and, 3 or even by -501, -500, and 500,000. The information content is the same, the average will have no meaningful interpretation.

# A.3 Interval Scale

#### **Interval Scale**

This scale can be used for many quantifiable variables: temperature (in degrees Celsius), where differences make sense. The difference between 1 and 2 degrees is the same as the difference between 100 and 101 degrees, and the average has a meaningful interpretation. The zero point has only an arbitrary meaning, just like using a number for an ordinal scale: it can be used as a name, but it is only a name.

Scale Type	Interval Scale
Characterization	difference between labels is mean-
	ingful (e.g. the Celsius scale for tem-
	perature)
Permissible Statistics	mean, standard deviation, correla-
	tion, regression, analysis of variance
Permissible Scale Transforma-	affine
tion	
Structure	affine line

#### Table A.3: Characterization of the Interval Scale of Measurement.

Rescaling is possible and remains meaningful. For example, a conversion from Celsius to Fahrenheit is possible via the following formula,  $T_f = \frac{9}{5}T_c + 32$ , with  $T_c$  the temperature in Celsius and  $T_f$  the temperature in Fahrenheit.

An affine transformation is a linear transformation of the form y = A.x+b. In Euclidean space an affine transformation will preserve collinearity (so that lines that lie on a line remain on a line) and ratios of distances along a line (for distinct collinear points  $p_1, p_2, p_3$ , the ratio  $||p_2 - p_1||/||p_3 - p_2||$  is preserved).

In general, an affine transformation is composed of linear transformations (rotation, scaling and/or shear) and a translation (or "shift"). An affine transformation is an internal operation and several linear transformations can be combined into one transformation.

# A.4 Ratio Scale

#### **Ratio Scale**

Using the Kelvin scale for temperature allows us to use a ratio scale: here not only the distances between the degrees but also the zero point is meaningful. Among the many examples are profit, loss, value, price, etc. Also a coherent risk measure is a ratio scale, because of the property translational invariance implies the existence of a true zero point.

## APPENDIX A. LEVELS OF MEASUREMENT

Scale Type	Ratio Scale
Characterization	a true zero point exists (e.g. VAR, VaR, ES)
Permissible Statistics	geometric mean, harmonic mean, co- efficient of variation, logarithms, etc.
Permissible Scale Transforma- tion	multiplication
Structure	field

 Table A.4: Characterization of the Ratio Scale of Measurement.
